

AMENDMENTS TO THE SPECIFICATION

Please amend the paragraph beginning on page 1, line 21, as follows:

Among display devices using the LCD, an LCD monitor or an LCD television receiver does not require a high speed driving IC because ~~pixels as many as~~ as many pixels as needed for the resolution are constructed in a matrix form and one driving channel is connected to each pixel. Thus, it is not difficult to design or fabricate the driving IC of the display devices.

Please amend the paragraph beginning on page 2, line 1, as follows:

However, in case of an LCD projection display device which forms a large screen in a projection method, since the driving channels that can be connected to the high resolution LCD are limited, the driving channels should be multiplexed at a high speed so as to be driven.
